Paradox: AI for confidential documents

Information for IT and data protection teams

October 2026
najjar961.github.io/paradox

Paradox is an AI assistant that lets staff ask about, summarise, edit, redact and compare documents **without the documents going to a cloud provider or being stored**. The model runs on the user's own device or your own server. The source code is open (AGPL-3.0), and every statement on this sheet can be checked.

Two ways to run it

	Paradox Lite (in the browser)	Self-hosted (your server)
Where does the AI run?	On the workstation's graphics card (WebGPU)	On your server, with Ollama in the same Docker network
Where are the documents?	Only in the memory of the browser tab	Only in the server's memory, per login session
When are they deleted?	When the tab is closed, or with one click	Sign-out, 30 min idle, 8 h maximum, restart
What goes to the internet?	Only a one-time download of the app and public AI models. No uploads.	Nothing, once the models are downloaded (can run fully offline)
Installation	None. Optional: host the static files on your intranet	docker compose; accounts in a file with bcrypt hashes

Data protection (GDPR)

- **No service provider processes documents.** With Paradox Lite, or self-hosted with a local model, all content stays inside the company. Document content is never transferred to third parties or third countries.
- **Storage limitation and data minimisation** (Art. 5 GDPR): no database, no files, no content in logs. Data exists only while it is being used.
- **Built-in redaction:** names, addresses, IBANs and ID numbers are truly removed from PDF, Word, Excel and PowerPoint, including author and metadata.
- **Optional cloud models** (OpenAI, Anthropic) are off by default. Turning them on requires the usual data processing agreements.

Technical measures (Art. 32 GDPR)

- Content Security Policy: the browser blocks every connection except to the app and the model hosts
- No browser storage of content (no localStorage, no IndexedDB)
- Container with a read-only file system, RAM-only scratch space, all capabilities dropped
- bcrypt passwords, login rate limiting, CSRF protection, HttpOnly/SameSite cookies, HSTS
- Strict session isolation; protection against prompt injection from documents
- Automated tests on every change, including “nothing is written to disk”

Check it yourself in 5 minutes

- Developer tools (F12) → Network: uploading and asking sends no request containing the document.
- Turn off Wi-Fi and reload: Paradox Lite keeps working.
- Developer tools → Application → Storage: no document and no chat is stored.
- Server: `docker compose exec paradox touch /srv/test` → “Read-only file system”.

Honest limits

- Paradox can't protect against malware or browser extensions on the workstation.
- Loading the app and models shows GitHub and Hugging Face the IP address. Fix: serve the app and models internally.
- AI can be wrong. Answers cite sources; edits and redactions show a preview of the real file first.
- Lite needs Chrome or Edge and a graphics card with a few GB of memory.

Getting started

- **Try it now:** najjar961.github.io/paradox/app
- **Self-host:** github.com/najjar961/paradox (guide in the README)
- **Security page:** najjar961.github.io/paradox/security.html
